# M Series

## 50 Watt DC-DC and AC-DC Converters

### Features

- Extremely wide operating input voltage ranges from 8 to 385 VDC and 85 to 264 VAC, 47 to 440 Hz
- RoHS lead-free-solder and lead-solder-exempted products available
- Class I equipment
- Input over- and undervoltage lockout
- 1, 2, or 3 individually isolated outputs up to 72 V
- Outputs: ES1, no load, overload, short-circuit proof, rectangular current limiting characteristic
- Adjustable output voltages with remote on/off
- Immunity according to IEC/EN 61000-4-2, -3, -4, -5, -6
- Emissions according to EN 55011/55032
- According to EN 45545 and NF-F-16 (Version V107 or later)
- All PCBs boards coated by protective lacquer
- Very high reliability
- Battery charger models available

Safety-approved to the latest edition of IEC/EN 62368-1 and UL/CSA 60950-1

### Description

The M Series of DC-DC and AC-DC converters represents a broad and flexible range of power supplies for use in advanced industrial electronic systems. Features include high efficiency, reliability, low output voltage noise and excellent dynamic response to load/line changes due to individual regulation of each output.

The converter inputs are protected against surges and transients occurring at the source lines. An input over- and undervoltage lockout circuit disables the outputs, if the input voltage is outside the specified range. An inrush current limitation prevents circuit breakers and fuses from tripping at switch-on.

All outputs are open- and short-circuit proof, and are protected against overvoltages by means of built-in suppressor diodes. The outputs can be inhibited by a logic signal applied to the connector (pin 2). If the inhibit function is not used, pin 2 should be connected to pin 23 to enable the outputs.

LED indicators display the status of the converter and allow visual monitoring of the system at any time.

Full input to output, input to case, output to case, and output to output isolation is provided.

The case design allows operation at nominal load up to 71 °C in a free-air ambient temperature. If forced cooling is provided, the ambient temperature may exceed 71 °C but the case temperature should remain below 95 °C under all conditions.

A temperature sensor generates an inhibit signal, which disables the outputs, when the case temperature TC exceeds the limit. The outputs automatically recover, when the temperature drops below the limit.

Various options are available to adapt the converters to individual applications.

The converters may either be plugged into a 19" rack system according to IEC 60927-3 or be mounted onto a chassis or a plate.

### Model Selection

Non-standard input/output configurations or special custom adoptions are available on request. Table 1 provides an overview of the basic input and output configurations. More than 1000 different model types have been manufactured with different input/output configurations and customized specialties. Please consult the company for additional model types.

Table 1a: Standard models AM, BM, FM

	customer-specific ....	-0, -5, -6, -8	
Auxiliary functions and options:			
Inrush current limitation (CM, EM, LM) .....		E	
Output voltage control input (single-output models) .....		R <sup>2</sup>	
Potentiometers for adjustment of output voltages .....		P <sup>2</sup>	
Save data signal (D0 – D9, to be specified) .....		D <sup>1</sup>	
ACFAIL signal (V0, V2, V3, to be specified) .....		V <sup>1</sup>	
Output voltage test sockets .....		A	
Increased electric strength test voltage .....		H	
Input fuse built-in (not accessible) .....		F <sup>3</sup>	
Coding strip at the connector .....		K	
RoHS-compliant for all 6 substances .....		G	

<sup>1</sup> Option D excludes option V and vice versa

<sup>2</sup> Feature R is fitted to single-output models only. Option P excludes option R (and vice versa).

<sup>3</sup> Only for FM1000

<sup>4</sup> Models with 220 mm case length. Just add 6000 to the standard model number, e.g., DM3020-9AG → DM9020-9AG.

NFND: Not for new designs.

Preferred: Preferred for new designs

**Note:** The sequence of options must follow the order above. The part number description is descriptive only; it is not intended for creating part numbers.

**Example:** CM2540-9EPD3AHG: DC-DC converter, operating input voltage range 28 – 140 VDC, providing output 1 with 15 V/1.7 A and output 2 with 15 V/1.7 A; temperature range -40 to +71 °C, inrush current limitation, equipped with potentiometers, undervoltage monitor D3, test sockets, tested with higher voltage output to case, RoHS-compliant for all 6 substances.

### Product Marking

Basic type designation, applicable approval marks, CE mark, warnings, pin designation, patents and company logo, identification of LEDs, test sockets, and potentiometer.

Specific type designation, input voltage range, nominal output voltages and currents, degree of protection, batch no., serial no., and data code including production site, modification status (version), and date of production.

## Functional Description

The input voltage is fed via an input fuse, an input filter, a bridge rectifier, and an inrush current limiter to the input capacitor. This capacitor sources a single-transistor forward converter. Each output is powered by a separate secondary winding of the main transformer. The resultant voltages are rectified and their ripple smoothed by a power choke and an output filter. The main control circuit senses the main output voltage  $V_{o1}$  and generates, with respect to the maximum admissible output currents, the control signal for the primary switching transistor. This signal is transferred to the primary side by a coupling transformer.

The auxiliary output voltages  $V_{o2}$  and  $V_{o3}$  are individually regulated by means of secondary switching transistors. Each auxiliary output's current is sensed using a current transformer. If one of the outputs is driven into current limit, the other outputs will reduce their output voltages as well, because all output currents are controlled by the same main control circuit.

- 1 Transient suppressor diode in AM, BM, CM, FM models.
- 2 Bridge rectifier in LM, series diode in EM models.
- 3 Inrush current limiter (NTC) in CM, DM, EM, LM models (option E: refer to the description of option E).
- 4 Single-output models with feature R.
- 5 LM-models

Fig. 1  
Block diagram, triple-output models

### Electrical Input Data

General conditions:

- $T_A = 25\text{ °C}$ , unless  $T_C$  is specified.
- Connector pins 2 and 23 interconnected, R input not connected; with option P:  $V_o = V_{o\text{ nom}}$

Table 2a: Input data

Model			AM			BM			FM			CM			Unit
Characteristics		Conditions	min	typ	max	min	typ	max	min	typ	max	min	typ	max	
$V_i$	Operating input voltage	$I_o = 0 - I_{o\text{ nom}}$	8		35	14		70	20		100	28		154 <sup>7</sup>	VDC

$C_i$	Input capacitance		140		270	140		270	140		270	140		270	μF
$V_{i\text{ abs}}$	Input voltage limits without any damage		0		400 <sup>5</sup>	-400		400	-400		400	0		284	VDC
			-		-	-		-	-	0		-			

<sup>1</sup> In AC powered mode (LM models): Nominal input voltage range: 100 – 240 VAC, operating input frequency range: 47 – 440 Hz

<sup>2</sup> With multiple-output models, the same condition for each output applies.

<sup>3</sup>  $R_S$  = source resistance.

<sup>4</sup> Value for initial switch-on cycle.

<sup>5</sup> 1 s max., duty cycle 1% max.

<sup>6</sup>  $I_{i\text{ nr p}} = V_i / (R_S + R_i)$ ; see *Inrush Current*.

<sup>7</sup> 140 V continuously. CM models with version V106 or greater (or with suffix /131) withstand 154 V for 2 s.

### Input Fuse

A fuse holder containing a slow-blow type fuse (size: 5 × 20 mm) is mounted in the back plate of the converter. The fuse protects the converter against severe defects. It may not fully protect it at input voltages exceeding 200 VDC. In applications, where the converters operate at DC source voltages above 200 VDC, an external fuse or a circuit breaker at system level should be installed. The fuse and a VDR form together with the input filter an effective protection against high input transients.

**Note:** For applications, where the fuse should not be accessible; see *Option F*.

Table 3: Fuse types (slow-blow)

Series	Schurter type	Part number
AM1000 – 3000	SPT 10 A / 250 V	0001.2514
BM1000 – 3000	SPT 8 A / 250 V	0001.2513
FM1000 – 3000	SPT 5 A / 250 V	0001.2511
CM1000 – 3000	SPT 3.15 A / 250 V	0001.2509
DM1000 – 3000 EM1000 – 3000 LM1000 – 3000	SPT 2.5 A / 250 V	0001.2508

Fig. 2  
Typical input current versus relative input voltage at nominal output load

Fig. 3  
Typical inrush current at initial switch-on.  $V_{i\max}$  (DC) and nominal output load

### Inrush Current

The CM, DM, EM, and LM (excluding FM) models incorporate an NTC resistor in the input line, which (during the initial switch-on cycle) limits the peak inrush current in order to prevent the connectors and external switching devices from damage. Subsequent switch-on cycles within a short interval will cause an increase of the peak inrush current due to the warming-up of the NTC resistor. Refer to *Option E* (only available for CM, EM, and LM).

### Input Under-/Overvoltage Lockout

If the input voltage remains below  $0.8 V_{i\min}$  or exceeds approx.  $1.1 V_{i\max}$ , an internally generated inhibit signal disables the output(s). When checking this function the absolute maximum input voltage rating  $V_{i\text{abs}}$  must be carefully considered (see table *Input data*).

**Note:** When  $V_i$  is between  $V_{i\min}$  and the undervoltage lockout level, the output voltage may be below the value defined in table *Output data*.

### Reverse Polarity

Reverse polarity at the input of AM, BM, CM, DM, and FM models will cause the fuse to blow. In EM and LM models a series diode will protect the converter. A series diode is not incorporated in AM, BM, CM, DM and FM types to avoid unwanted power losses.

### Electrical Output Data

General Conditions:

- $T_A = 25\text{ °C}$ , unless  $T_C$  is specified.
- Connector pins 2 and 23 interconnected, R input not connected; with option P:  $V_o = V_{o, \text{nom}}$

<sup>1</sup> With multiple-output models, all outputs are loaded with the nominal current.

<sup>2</sup> Condition for specified output. With multiple-output models, other output(s) loaded with constant current  $I_{o, \text{nom}}$ . See fig. 5 *Dynamic load regulation*.

<sup>3</sup> Condition for non-specified output, individually tested, other output(s) loaded with constant current  $I_{o, \text{nom}}$ . See fig. 5 *Dynamic load regulation*.

<sup>4</sup> Multiple-output models.

<sup>5</sup> By suppressor diode.

### Output Characteristic and Protection

Each output is protected by a suppressor diode, which under worst case conditions may become a short circuit. The suppressor diodes are not designed to withstand externally applied overvoltages. Overload at any of the outputs will cause a shutdown of all outputs. A red LED indicates an overload condition at the respective output.

Fig. 4  
Typical voltage  $V_o$  versus output currents  $I_o$ .

Fig. 5  
Dynamic load regulation  $V_{o,d}$  versus load change.

### Thermal Considerations and Protection

If a converter is located in free, quasi-stationary air (convection cooling) at the indicated maximum ambient temperature  $T_{A,max}$  (see table *Temperature specifications*) and is operated at its nominal input voltage and output power, the temperature measured at the measuring point of case temperature  $T_C$  (see *Mechanical Data*) will approach the indicated value  $T_{C,max}$  after the warm-up phase. However, the relationship between  $T_A$  and  $T_C$  depends heavily on the conditions of operation and integration into a system. The thermal conditions are influenced by input voltage, output current, airflow, and temperature of surrounding components and surfaces.  $T_{A,max}$  is therefore, contrary to  $T_{C,max}$ , an indicative value only.

**Caution:** The installer must ensure that under all operating conditions  $T_C$  remains within the limits stated in the table *Temperature specifications*.

**Notes:** Sufficient forced cooling or an additional heat sink allow  $T_A$  to pass over  $71^\circ\text{C}$ , if  $T_{C,max}$  is not exceeded.

For -7 or -9 models at an ambient temperature  $T_A$  of  $85^\circ\text{C}$  with only convection cooling, the maximum permissible current for each output is approx. 50% of its nominal value; see figure 6.

A temperature sensor generates an internal inhibit signal disabling the outputs, when the case temperature exceeds  $T_{C,max}$ . The outputs automatically recover, when the temperature drops below this limit.

Fig. 6  
Output current derating versus temperature

### Parallel and Series Connection

Main outputs of equal nominal voltage can be connected in parallel. It is important to assure that the main output of a multiple-output converter is forced to supply a minimum current of 0.1 A to enable correct operation of its own auxiliary outputs.

In parallel operation, one or more of the main outputs may operate continuously in current limitation, causing an increase of the case temperature  $T_c$ . Consequently, a reduction of the max. ambient temperature by 10 K is recommended.

Main or auxiliary outputs can be connected in series with any other output of the same or another converter. In series connection, the maximum output current is limited by the lowest current limit. Output ripple and regulation values are added. Connection wiring should be kept as short as possible.

If output terminals are connected together in order to establish multi-voltage configurations, e.g., +5.1 V, ±12 V etc., the common-ground connecting point should be as close as possible to the connectors of the converter in order to avoid excessive output ripple voltages.

**Note:** Auxiliary outputs should never be connected in parallel!

### Output Current Allocation for Special Models

Output currents differing from those given for standard models (see *Model Selection*) can be provided on request. A maximum output power of 50 W should be considered, if an ambient temperature range of –40 to 71 °C is required. The maximum permissible output currents are indicated in the table below. If the output voltages are different from standard values, the relevant output currents have to be adapted accordingly.

With reduced maximum ambient temperature or with forced cooling, the total output power may exceed 50 W. Customized configurations always need to be checked by a feasibility study first. Please ask the Company for more information.

Table 5: Current allocation with special models

Output voltage all types $V_{o1/2/3 \text{ nom}}$ [V]	Output 1 all types $I_{o1 \text{ max}}$ [A]	Output 2 AM – LM2000 $I_{o2 \text{ max}}$ [A]	Output 2 AM – LM3000 $I_{o2 \text{ max}}$ [A]	Output 3 AM – LM3000 $I_{o3 \text{ max}}$ [A]	Temperature	
					$T_A$ [°C]	$T_c$ [°C]
5.1	8.0	4.0	1.8 (2.5 <sup>1</sup> )	1.5	–40 to 71	–25 to 95

15	4.6	2.3	1.7	1.5		
24	3.0	1.5	1.0	0.8		

<sup>1</sup> Special high-current components required.

<sup>2</sup>  $V_{i \text{ min}}$  has to be increased.

### Hold-up Time and Output Response

When the input voltage is switched off, the output voltage will remain high for a certain hold-up time  $t_h$  (see fig. 7) before the output voltage falls below  $0.95 V_{o,nom}$ . To achieve the hold-up times indicated in fig. 8, AM, BM, CM, DM, and FM models require an external series diode in the input line. This is necessary to prevent the discharge of the input capacitor through the source impedance or other circuits connected to the same source. EM and LM models have a built-in series diode. In AM, BM, CM, DM, and FM models, no series diode is built-in, since it would generate additional power losses inside the converter.

**Note:** For hold-up time with option V, refer to *Option V*.

The behavior of the outputs is similar with either the input voltage applied or the inhibit switched low.

No output voltage overshoot occurs, when the converter is turned on or off.

Fig. 7  
Output response times versus  $V_i$  or inhibit control

Fig. 8  
Typical hold-up time  $t_h$  versus input voltage at  $I_{o,nom}$

Table 6: Output response time  $t_r$  and  $t_f$  (see fig. 7). Values not applicable for models equipped with option E.

Type of converter	$t_r$ at $P_o = 0$ and $t_f$ at $P_o = P_{o,nom}$		$t_r$ and $t_f$ at $P_o = \frac{3}{4} P_{o,nom}$		$t_r$ and $P_o = P_{o,nom}$		Unit
	typ	max	typ	max	typ	max	
AM – LM1001-9R	5	10	5	10	10	20	ms
AM – LM1301-9R	10	20	15	30	20	30	
AM – LM1501-9R	5	10	10	20	30	40	
AM – LM1601-9R	15	30	25	50	40	60	
AM – LM1901-9R	65	130	100	200	165	330	
AM – LM2320-9	20	40	30	60	50	100	
AM – LM2540-9	15	30	20	40	35	70	
AM – LM3020-9	55	110	85	170	145	290	
AM – LM3040-9	40	80	60	120	100	200	

Conditions:

R input not connected. For multiple-output models the figures indicated in the table relate to the output, which reacts slowest. All outputs are resistively loaded. Variation of the input voltage within  $V_{i,min} - V_{i,max}$  does not influence the values considerably.

## Auxiliary Functions

### Inhibit

The outputs of the converters may be enabled or disabled by means of a logic signal (TTL, CMOS, etc.) applied between the inhibit input *i* and the negative pin of output 1 ( $V_{o1-}$ ). In systems with several converters, this feature can be used, for example, to control the activation sequence of the converters. If the inhibit function is not required, connect the inhibit pin 2 to pin 23 to enable the outputs (active low logic, fail safe). The response times are specified in table 6.

Fig. 9  
Definition of  $V_{inh}$  and  $I_{inh}$ .

Fig. 9  
Definition of  $V_{inh}$  and  $I_{inh}$ .

Table 7: Inhibit data

Characteristics		Conditions	min	typ	max	Unit
$V_{inh}$	Inhibit input voltage to keep output voltage	$V_o = \text{on}$	$V_{i \min} - V_{i \max}$	-50	0.8	V
		$V_o = \text{off}$	$T_{C \min} - T_{C \max}$	2.4	50	
$I_{inh}$	Inhibit current	$V_{inh} = 0$	-60	-100	-220	$\mu\text{A}$

### R-Control for Output Voltage Adjustment

As a standard feature, single-output models without option P offer an adjustable output voltage identified by letter R in the type designation.

**Note:** With open R input,  $V_o = V_{o \text{ nom}}$ .

The output voltage  $V_o$  can either be adjusted by an external voltage ( $V_{ext}$ ) or by an external resistor ( $R_{ext1}$  or  $R_{ext2}$ ). The adjustment range is approximative 0 – 110% of  $V_{o \text{ nom}}$ . For output voltages  $V_o > V_{o \text{ nom}}$ , the minimum input voltage  $V_{i \min}$  specified in *Electrical Input Data* increases proportionally to  $V_o/V_{o \text{ nom}}$ .

Fig. 11  
Output voltage adjustment

### a) Adjustment by means of an external resistor $R_{ext}$ .

Depending upon the value of the required output voltage, the resistor shall be connected:

**either:** Between the R and G pin to achieve an output voltage adjustment range of  $V_o \approx 0$  to 100 % of  $V_{o,nom}$ .

$$R_{ext1} \approx 4 \text{ k}\Omega \cdot \frac{V_o}{V_{o,nom} - V_o}$$

**or:** Between the R pin and Vo+ to achieve an output voltage range of  $V_o \approx 100$  to 110% of  $V_{o,nom}$ .  
( $V_o - 2.5 \text{ V}$ )

$$R_{ext2} \approx 4 \text{ k}\Omega \cdot \frac{V_o}{2.5 \text{ V} \cdot (V_o/V_{o,nom} - 1)}$$

**Caution:** To prevent damage,  $R_{ext2}$  should never be less than 47 k $\Omega$ .

**Note:** R inputs of n converters with paralleled outputs may be paralleled too, but if only one external resistor is used, its value should be  $R_{ext1}/n$  or  $R_{ext2}/n$  respectively.

### b) Adjustment by means of an external control voltage $V_{ext}$ between G and R pin.

The control voltage range is 0 to 2.75 V and allows for adjustment in the range of  $V_o \approx 0$  to 110% of  $V_{o,nom}$ .

$$V_{ext} \approx \frac{V_o \cdot 2.5 \text{ V}}{V_{o,nom}}$$

**Caution:** The external control voltage should be in the range 0 to +3V to prevent the converter from damage.

Table 8a:  $R_{ext1}$  for  $V_o < V_{o,nom}$  (Conditions:  $V_{i,nom}$ ,  $I_{o,nom}$ , rounded up to resistor values E 96,  $R_{ext2}$  is not fitted.)

### Display Status of LEDs

LEDs "OK", "i" and " $I_{oL}$ " status versus input voltage  
 Conditions:  $I_o \leq I_{o\text{nom}}$ ,  $T_C \leq T_{C\text{max}}$ ,  $V_{i\text{inh}} \leq 0.8\text{ V}$   
 $V_{i\text{uv}}$  = undervoltage lock-out,  $V_{i\text{ov}}$  = overvoltage lock-out

LEDs "OK" and " $I_{oL}$ " status versus output current  
 Conditions:  $V_{i\text{min}} - V_{i\text{max}}$ ,  $T_C \leq T_{C\text{max}}$ ,  $V_{i\text{inh}} \leq 0.8\text{ V}$

LED "i" versus case temperature  
 Conditions:  $V_{i\text{min}} - V_{i\text{max}}$ ,  $I_o \leq I_{o\text{nom}}$ ,  $V_{i\text{inh}} \leq 0.8\text{ V}$

LED "i" versus  $V_{i\text{inh}}$   
 Conditions:  $V_{i\text{min}} - V_{i\text{max}}$ ,  $I_o \leq I_{o\text{nom}}$ ,  $T_C \leq T_{C\text{max}}$

Fig. 12  
LED indicators

### Electromagnetic Compatibility (EMC)

A suppressor diode or a metal oxide VDR (depending upon converter model) together with an input fuse and an input filter form an effective protection against high input transient voltages, which typically occur in most installations, but especially in battery-driven mobile applications. The M Series has been successfully tested to the following specifications:

### Electromagnetic Immunity

Table 9: Immunity type tests

Phenomenon	Standard	Level	Coupling mode <sup>1</sup>	Value applied	Waveform	Source imped.	Test procedure	In oper.	Perf. crit. <sup>2</sup>

**Note:** Long case, elongated by 60 mm for 220 mm rack depth, is available on request.

## Safety and Installation Instructions

### Connector Pin Allocation

Pin no. 26 (protective earth) is a leading pin, ensuring that it makes contact with the female connector first.

Table 13: Pin allocation

Electrical determination	AM - LM1000		AM - LM2000		AM - LM3000	
	Pin	Ident	Pin	Ident	Pin	Ident
Inhibit Safe data or ACFAIL	2	i	2	i	2	i
	5 <sup>5</sup>	D or V	5 <sup>5</sup>	D or V	5 <sup>5</sup>	D or V
Output voltage (positive)	8	Vo+	8	n.c.	8	Vo3+

### Installation Instructions

All M Series converters are components, intended exclusively for inclusion within other equipment by professional installers. Installation must strictly follow the national safety regulations in compliance with the enclosure, mounting, creepage, clearance, casualty, markings and segregation requirements of the end-use application.

Connection to the system shall be made via the female connector H11. Other installation methods may not meet the safety requirements.

The converters are provided with the leading pin 26 (⊕), which is reliably connected with the case. For safety reasons, it is essential to connect pin 26 with the protective earth of the supply system.

An input fuse is connected in the line to pin 32 (Vi- or L≈). Since this fuse is designed to protect the converter in case of an overcurrent and does not necessarily cover all customer needs, an external fuse suitable for the application and in compliance with the local requirements may be necessary in the wiring to one or both input pins (no. 29 and/or no. 32), particularly if the phase or neutral line cannot be assigned to the corresponding terminals (LM models operated with AC).

**Important:** Whenever the inhibit function is not in use, pin 2 (i) should be connected to pin 23 (Vo-) to enable the output(s).

**Caution:** Do not open the converters, or warranty will be invalidated.

Make sure that there is sufficient air flow possible for convection cooling. This should be verified by measuring the case temperature  $T_C$ , when the converter is installed and operated in the end-use application. The maximum specified case temperature  $T_{C\max}$  shall not be exceeded. See also *Thermal Considerations*.

### Touch Current in LM Models

Touch current flow is caused by internal leakage capacitances and Y-capacitors. Maximum touch current at 264 V, 440 Hz is 7.9 mA. A warning marking is provided and is required in the end-use product.

### Protection Degree and Cleaning Liquids

Condition: Female connector fitted to the converter.

IP 40: All models, except those with options P or A, and except those with option D/V with potentiometer.

IP 30: All models fitted with options A or option D/V without potentiometer.

IP 20: All models fitted with option P or with option D/V with potentiometer.

In order to avoid possible damage, any penetration of liquids (e.g., cleaning fluids) has to be avoided.

### Railway Applications

The M Series converters have been designed observing the railway standards EN 50155 and EN 50121. All boards are coated with a protection lacquer.

### Standards and Approvals

The converters correspond to class I equipment and have been approved according to the standards IEC/EN 62368-1 and UL/CSA 60950-1.

The converters have been evaluated for:

- Class I equipment
- Building in
- Basic insulation between input and case and double or reinforced insulation between input and output, based on the input voltage of 250 VAC or 400 VDC
- Functional insulation between output(s) and case
- Functional insulation between the outputs
- Pollution degree 2 environment
- Overvoltage category II
- Altitude up to 2000 m

The converters are subject to manufacturing surveillance in accordance with the above mentioned standards and with ISO 9001:2015.

### Isolation

The electric strength test is performed in the factory as routine test in accordance with EN 62911 and IEC/EN 62368-1. The company will not honor any warranty claims resulting from incorrectly executed electric strength field tests.

Table 14: Isolation

Characteristics		Input to Case + Output(s)	Output(s) to Case (standard)	Output(s) to Case (option H)	Output to Output	Unit
Electric strength test	Factory test >1 s	2.8 <sup>1</sup>	1.4	2.8	0.3	kVDC
	AC test voltage equivalent to factory test	2.0 <sup>1</sup>	1.0	2.0	0.2	kVAC
Insulation resistance at 500 VDC		>300	>300	>300	>100 <sup>2</sup>	MΩ
Creepage distances		≥ 3.2 <sup>3</sup>	---	---	---	mm

<sup>1</sup> Subassemblies connecting input to output are pre-tested with 5.6 kVDC or 4 kVAC.

<sup>2</sup> Tested at 300 VDC

<sup>3</sup> Input to outputs: ≥6.4 mm

### Safety of Operator-Accessible Output Circuits

If the output circuit of a DC-DC converter is operator-accessible, it shall be an ES1 circuit according to the IEC/EN 62368-1 safety standards.

Since the M Series converters provide double or reinforced insulation between input and output based upon a rated primary input voltage of 250 VAC or 400 VDC, only functional insulation is needed between the AC mains and the input of the converter.

Only voltage adaption and rectification to the specified input voltage range of a DC/DC converter is needed.

Table 15 shows a possible installation configuration, compliance with which causes the output circuit of the DC-DC converter to be an ES1 circuit according to IEC/EN 62368-1 up to a configured output voltage (sum of nominal voltages if in series or +/- configuration) of 48 V. However, it is the sole responsibility of the installer to assure the compliance with the relevant and applicable safety regulations.

Fig. 17  
Schematic safety concept

Table 15: Safety concept leading to an ES1 output circuit

Conditions	Front end			DC-DC converter		Result
	Minimum required grade of insulation, to be provided by the AC-DC front end, including mains supplied battery charger	Maximum rated DC output voltage from the front end	Minimum required safety status of the front end output circuit	Equipment	Measures to achieve the specified safety status of the output circuit	
Nominal supply voltage	Minimum required grade of insulation, to be provided by the AC-DC front end, including mains supplied battery charger	Maximum rated DC output voltage from the front end	Minimum required safety status of the front end output circuit	Equipment	Measures to achieve the specified safety status of the output circuit	Safety status of the DC-DC converter output circuit
Mains 250 VAC	Operational (i.e. there is no need for electrical isolation between the mains supply voltage and the DC-DC converter input voltage)	400 VDC <sup>1</sup> (The rated voltage between any input pin and earth can be up to 250 VAC or 400 VDC)	Primary circuit	A-LM	Double or reinforced insulation, based on 250 VAC and 400 VDC (provided by the DC-DC converter) and earthed case <sup>2</sup>	ES1 circuit

<sup>1</sup> The front end output voltage should match the specified operating input voltage range of the DC-DC converter.

<sup>2</sup> The earth connection has to be provided by the installer according to the safety standard IEC/EN 62368-1.

## Description of Options

Table 16: Survey of options

Option	Function of option	Characteristics
- 7	Former standard operational ambient temperature range	$T_A = -25$ to $71$ °C
A	Test sockets at front panel for check of output voltage	$V_o$ internally measured at the connector terminals
E	Electronic inrush current limitation circuitry	Active inrush current limitation, only for CM, EM, LM models
P <sup>1</sup>	Potentiometer for fine adjustment of output voltage	Adjustment range $\pm 5\%$ of $V_{o, nom}$ , excludes R input
F	Input fuse built-in	Fuse not externally accessible, only for FM1000
H	Enhanced output to case electric strength test voltage	See table <i>Isolation</i>
D <sup>2</sup>	Input and/or output undervoltage monitoring circuitry	Safe data signal output (D0 – D9)
V <sup>2,3</sup>	Input and/or output undervoltage monitoring circuitry	ACFAIL signal according to VME specifications (V0, V2, V3)
K	Coding strip at the connector	Ensuring correct population of DIN-racks
G	RoHS	RoHS-compatible for all six substances

<sup>1</sup> Models equipped with option P do not provide the R function; pins 14 and 17 are not connected.

<sup>2</sup> Option D excludes option V and vice versa.

<sup>3</sup> Only available if main output voltage  $V_{o1} = 5.1$  V

### -7 Former Standard Temperature Range

Option -7 stays for the operational ambient temperature range from  $-25$  to  $71$  °C, which may be preferred by some customers for reasons of documentation or approvals.

### A Test Sockets

Test sockets (pin  $\varnothing = 2$  mm, distance  $d = 5.08$  mm) are located at the front of the converter. The output voltage is sensed at the connector pins inside of the converter. Outputs 2 and 3 of triple-output models are not sensed.

### P Potentiometer

Built-in multi-turn potentiometers provide an output voltage adjustment range of minimum  $\pm 5\%$  of  $V_{o, nom}$  and are accessible through holes in the front cover. Compensation of voltage drop across connector and wiring becomes easily achievable. For output voltages  $V_o > V_{o, nom}$ , the minimum input voltage according to *Electrical Input Data* increases proportionally to  $V_o/V_{o, nom}$ . Triple-output models allow only the adjustment of  $V_{o1}$ .

**Note:** Potentiometers are not recommended for mobile applications.

### E Electronic Inrush Current Limitation

Available for CM, EM and LM models.

The standard version of the models CM, DM, EM and LM include a passive inrush current limitation with an NTC resistor. For applications requiring an improved inrush current limitation, an active electronic circuit as shown in fig.18 has been developed. Typical inrush current waveforms of units equipped with this option are shown below.

CM models meet the CEPT/ETSI standards for 48V supply voltage according to ETS 300132-2, if fitted with option E combined with option D6 (input voltage monitoring). Option D6, externally adjustable via potentiometer, is necessary to disable the converter at input voltages below the actual service ranges, avoiding an excessive input current when the input voltage is raised slowly according to ETS 300132-2. Option D6 threshold level  $V_{ti} + V_{hi}$  (refer to description of option D) should be adjusted to  $36 - 40.5$  V for 48 V nominal supply voltage (for 60 V systems, threshold should be set to  $44 - 50$  V). The D output (pin 5) should be connected to the inhibit (pin 2). For applications, where potentiometers are not allowed, refer to option D9.

Table 18: Inrush current characteristics with option E

Characteristics		CM at $V_i = 110$ VDC		EM, LM at $V_i = 110$ VDC		EM, LM at $V_i = 372$ VDC		Unit
		typ	max	typ	max	typ	max	
$I_{inr p}$	Peak inrush current	6.5	8	2.2	4	7.3	10	A
$t_{inr}$	Inrush current duration	22	30	10	20	20	40	ms

Fig. 18  
Option E block diagram

Fig. 19  
Typical inrush current waveforms of CM, EM, and LM converters with option E

**Precautions:**

In order to avoid overload of the series resistor  $R_s$ , the on/off switching cycle should be limited to 12 s, if switched on/off continuously. There should not be more than 10 start-up cycles within 20 s at a case temperature of 25 °C.

If CM models are driven by input voltages below 35 VDC or LM models below 100 VAC, the maximum case temperature should be derated by 10 °C, or the total output power should be derated by 20%. EM and LM models driven by DC input voltages do not need to be derated within the full specified input voltage range.

**F Fuse Not Accessible**

Standard M converters have a fuseholder containing a 5 × 20 mm fuse, which is externally accessible and located in the back plate near to the connector. Some applications require an inaccessible fuse. Option F provides a fuse mounted directly onto the main PCB inside the case (only FM1000).

The full self-protecting functions of the converter do normally not lead to a broken fuse, except as a result of inverse polarity at the input of an AM, BM, CM, DM, or FM models, or if a power component inside fails. In such cases the defective converter must be returned to the Company for repair.

**H Enhanced Electric Strength Test**

Electric strength test output to case; see table *Isolation*.

**D Undervoltage Monitor**

The input and/or output undervoltage monitor operates independently of the built-in input undervoltage lock-out circuit. A logic “low” (JFET output) or “high” signal (NPN output) is generated at pin 5, when one of the monitored voltages drops below the preselected threshold level  $V_t$ . The return for this signal is Vo1– (pin 23). The D output recovers, when the monitored voltage(s) exceed(s)  $V_t + V_h$ . The threshold level  $V_t$  is either adjustable by a potentiometer accessible through a hole in the front cover, or adjusted in the factory to a fixed value specified by the customer.

Option D exists in various versions D0 – D9, as shown in the Table 19.

**JFET output (D0 – D4):**

Connector pin D is internally connected via the drain-source path of a JFET (self-conducting type) to the negative potential of output 1.  $V_D \leq 0.4$  V (logic low) corresponds to a monitored voltage level ( $V_i$  and/or  $V_{o1}$ ) <  $V_t$ . The current  $I_D$  through the JFET should not exceed 2.5 mA. The JFET is protected by a 0.5 W Zener diode of 8.2 V against external overvoltages.

**NPN output (D5 – D9):**

Connector pin D is internally connected via the collector-emitter path of a NPN transistor to the negative potential of output 1.  $V_D \leq 0.4$  V (logic low) corresponds to a monitored voltage level ( $V_i$  and/or  $V_{o1}$ ) >  $V_t + V_h$ . The current  $I_D$  through the open collector should not exceed 20 mA. The NPN output is not protected against external overvoltages.  $V_D$  should not exceed 40 V.

Table 19: Undervoltage monitor functions

Output type		Monitoring		Minimum adjustment range of threshold level $V_t$		Typ. hysteresis $V_h$ [% of $V_t$ ] for $V_{t\min} - V_{t\max}$	
JFET	NPN	$V_i$	$V_{o1}$	$V_{ti}$	$V_{to}$	$V_{hi}$	$V_{ho}$
D1	D5	no	yes	---	$3.5\text{ V} - 48\text{ V}^1$	---	$2.3 - 1\text{ V}$
D2	D6	yes	no	$V_{i\min} - V_{i\max}^1$	---	$3.0 - 0.5\text{ V}$	---

$V_i$ and $V_{o1} > V_t + V_h$	low, L, $V_D \leq 0.4\text{ V}$ at $I_D = 20\text{ mA}$

Fig. 20 Options D0 – D4, JFET output

Fig. 21 Options D5 – D9, NPN output

Threshold tolerances and hysteresis:

If  $V_i$  is monitored, the internal input voltage after the input filter and rectifier (EM and LM types) is measured. Consequently, this voltage differs from the voltage at the connector pins by the voltage drop  $\Delta V_{ti}$  across input filter and rectifier. The threshold level of the D0 and D9 options is adjusted in the factory at nominal output current  $I_{o\text{nom}}$  and  $T_A = 25\text{ }^\circ\text{C}$ . The value of  $\Delta V_{ti}$  depends upon input voltage range (AM, BM, etc.), threshold level  $V_t$ , temperature, and input current.

Fig. 22 Definition of  $V_{ti}$ ,  $\Delta V_{ti}$ , and  $V_{hi}$  (JFET output)

### Input voltage monitoring

### Output voltage monitoring

- <sup>1</sup> See *Electrical Output Data* for hold-up time.
- <sup>2</sup> With output voltage monitoring the hold-up time  $t_h = 0$
- <sup>3</sup> The D signal remains high, if the D output is connected to an external source.

Fig. 23  
Relationship between  $V_i$ ,  $V_o$ ,  $V_D$ ,  $V_o/V_{o\ nom}$  versus time

### V ACFAIL signal (VME)

Available for converters with  $V_{o1} = 5.1$  V. This option defines an undervoltage monitoring circuit for the input or the input and main output voltage equivalent to option D and generates the ACFAIL signal (V signal), which conforms to the VME standard. The low state level of the ACFAIL signal is specified at a sink current of  $I_V = 48$  mA to  $V_V \leq 0.6$  V (open-collector output). The pull-up resistor feeding the open-collector output should be placed on the VME backplane.

After the ACFAIL signal has gone low, the VME standard requires a hold-up time  $t_h$  of at least 4 ms before the 5.1 V output drops to 4.875 V, when the 5.1 V output is fully loaded. This hold-up time  $t_h$  is provided by the internal input capacitance. Consequently the working input voltage and the threshold level  $V_{ti}$  should be adequately above the minimum input voltage  $V_{imin}$  of the converter, so that enough energy is remaining in the input capacitance. If the input voltage is below the required level, an external hold-up capacitor ( $C_{iext}$ ) should be added.

Formula for threshold level for desired value of  $t_h$ :

$$V_{ti} = \sqrt{\frac{2 \cdot P_o \cdot (t_h + 0.3 \text{ ms}) \cdot 100}{C_{imin} \cdot \eta}} + V_{imin}^2$$

Formula for additional external input capacitor

$$C_{iext} = \frac{2 \cdot P_o \cdot (t_h + 0.3 \text{ ms}) \cdot 100}{\eta \cdot (V_{ti}^2 - V_{imin}^2)} - C_{imin}$$

where as:

$C_{imin}$  = internal input capacitance [mF],  
according to table below

$C_{iext}$  = external input capacitance [mF]

$P_o$  = output power [W]

$\eta$  = efficiency [%]

$t_h$  = hold-up time [ms]

$V_{imin}$  = minimum input voltage [V]<sup>1</sup>

$V_{ti}$  = threshold level [V]

**Notes:** The threshold level  $V_{ti}$  of option V2 and V3 is adjusted in the factory to a value according to the table below. A decoupling diode should be connected in series with the input of AM, BM, CM, DM, and FM converters to avoid the input capacitance discharging through other loads connected to the same source voltage. If LM models are powered by AC, an external input capacitor cannot be applied unless an additional rectifier is provided.

Table 20: Available internal input capacitance and factory potentiometer setting of  $U_{ti}$  with resulting hold-up time

Types	AM	BM	CM	DM	EM	FM	LM	Unit
$C_{imin}$	2.6	0.67	0.37	0.14	0.14	0.37	0.14	mF
$V_{ti}$	9.5	19.5	39	61	104	39	120	VDC
$t_h$	0.34	0.69	1.92	1.73	6.69	2.92	8.18	ms

Option V operates independently of the built-in input undervoltage lockout circuit. A logic “low” signal is generated at pin 5 as soon as one of the monitored voltages drops below the preselected threshold level  $V_t$ . The return for this signal is Vo1– (pin 23). The V output recovers, when the monitored voltage exceeds  $V_t + V_h$ . The threshold level  $V_t$  is either adjustable by a potentiometer, accessible through a hole in the front cover, or adjusted in the factory to a determined customer-specific value. Versions V0, V2 and V3 are available as shown below.

Table 21: Undervoltage monitor functions

V output (VME compatible)	Monitoring		Minimum adjustment range of threshold level $V_t$		Typical hysteresis $U_h$ [% of $V_t$ ] for $V_{tmin} - V_{tmax}$	
	$V_i$	$V_{o1}$	$V_{ti}$	$V_{to}$	$V_{hi}$	$V_{ho}$
V2	yes	no	$V_{imin} - V_{imax}^1$	---	3.0 – 0.5 V	---
V3	yes	yes	$V_{imin} - V_{imax}^1$	$0.95 - 0.98 V_{o1}^2$	3.0 – 0.5 V	“0”
V0	yes	no	$V_{imin} - V_{imax}^{3,4}$	---	2.2 – 0.4 V	---
	yes	yes	$V_{imin} - V_{imax}^{3,4}$	$0.95 - 0.98 V_{o1}^2$	2.2 – 0.4 V	“0”

<sup>1</sup> Threshold level adjustable by potentiometer (not recommended for mobile applications).

<sup>2</sup> Fixed value between 95% and 98% of  $V_{o1}$  (tracking), output undervoltage monitoring is not a requirement of VME standard.

<sup>3</sup> Adjusted at  $I_{o,nom}$ .

<sup>4</sup> Fixed value, resistor-adjusted ( $\pm 2\%$ ) acc. to customer’s specifications; individual type designation is determined by the company.

### V output (V0, V2, V3):

Connector pin V is internally connected to the open collector of a NPN transistor. The emitter is connected to the negative potential of output 1.  $V_V$  0.6 V (logic low) corresponds to a monitored voltage level ( $V_i$  and/or  $V_{o1}$ )  $< U_t$ . The current  $I_V$  through the open collector should not exceed 50 mA. The NPN output is not protected against external overvoltages.  $V_V$  should not exceed 80 V.

$V_i, V_{o1}$ status	V output, $V_V$
$V_i$ or $V_{o1} < V_t$	low, L, $V_V \leq 0.6$ V at $I_V = 50$ mA
$V_i$ and $V_{o1} > V_t + V_h$	high, H, $I_V \leq 25$ $\mu$ A at $V_V = 5.1$ V

Output configuration of options V0, V2, V3

### Threshold tolerances and hysteresis

$V_i$  is monitored after the input filter and rectifier (EM and LM models). Consequently, this voltage differs from the voltage at the connector pins by the voltage drop  $\Delta V_{ti}$  across input filter and rectifier. The threshold level of option V0 is factory-adjusted at  $I_{o, nom}$  and  $T_A = 25$  °C.  $\Delta V_{ti}$  depends upon the input voltage range (AM, BM, ...), threshold level  $V_{ti}$ , temperature, and input current.

Fig. 25  
Definition of  $V_{ti}$ ,  $\Delta V_{ti}$  and  $V_{hi}$

Fig. 26 Relationship between  $V_P$ ,  $V_{o1}$ ,  $V_V$ ,  $I_V$ , and  $V_{o1}/V_{o\ nom}$  versus time.

### K Coding Strip

A plastic part across the connector ensures correct population of the DIN-rack.

### G RoHS

RoHS-compatible for all six substances. For the dimensions of the cooling plates, see *Mechanical Data*. Option B2 is for customer-specific models with elongated case (for 220 mm DIN-rack depth).

### Accessories

A great variety of electrical and mechanical accessories are available including:

- Various mating H11 connectors including solder, fast-on, or press-fit terminals
- Pair of connector retention clips HZZ01209-G
- Code key system: 5 coding wedges HZZ00202-G
- Various front panels for 19" rack mounting
- Flexible H11 PCB board HZZ01208-G for connecting with a mother board
- Universal mounting bracket UMB-LHMQ (HZZ00610-G) for chassis or DIN-rail mounting in upright position.
- DIN-rail mounting brackets DMB-MHQ (HZZ00619-G)
- Mounting plate M (HZZ01208) for chassis or a wall mounting, where only frontal access is given
- Battery sensor [S-KSMH...] for using the converter as battery charger (different cell characteristics).

**For additional accessory product information, see the accessory data sheets listed with each product series or individual model at our web site.**
